CARGOLANE · SALES

Cargolane — One-Pager

Freight forwarding software built in the Gulf, for the Gulf. Arabic and English from the first line of code. Your brand, your database, your data.

The problem you already have

Your rates live in spreadsheets, so a quotation takes a day and a half. Your enquiries live in four mailboxes, so nobody owns them and nobody is timed. Your customers find out where their container is by ringing someone who has to go and find out. And your margin on a job is a thing you reconstruct at month-end, not a number you knew when you quoted.

None of that is a technology problem. It is a *system of record* problem, and it costs you the jobs you priced too slowly and the ones you priced too cheaply.

What Cargolane does about it

Quote in seconds, not days	Load your carrier contracts once. An enquiry prices itself off your own buy and sell cards — sea FCL, sea LCL, air, land and courier — with chargeable weight, accessorials and the margin shown before you send it.
One queue, with a clock on it	Every enquiry across every branch, with an owner and a response deadline. What breached, what is due today, who has not replied.
An operations board that surfaces the problem	Live shipments ordered by what is wrong, oldest first — the one nobody has looked at is the one the process missed. Milestones, containers, vessel and voyage, customs status, ETA.
Free time that counts itself	Demurrage, detention and storage clocks run against the carrier's free days and write their own charge line. Nobody has to remember.
Your customers stop calling	A public tracking page — reference plus a container or bill number, no login — and a full customer portal with released documents. Both in Arabic and English.
Money you are owed, on one screen	Invoices in three jurisdictions and three currencies, receipts, ageing buckets, and who to ring about the oldest debt. Every charge line stores its own FX rate and the moment it was taken.
An audit trail nobody can edit	Written by the database, not the application. `UPDATE` and `DELETE` on it are revoked from every role — including ours.

Why it is different from what you have been shown

It is bilingual, not translated. 1,407 interface strings in Arabic and English, in sync, with right-to-left layout built in from the first commit rather than retrofitted. Your quotation and your tracking page read correctly in Arabic because they were designed to, not because a plugin flipped them.

It is your brand everywhere. Logo, colours, letterhead, domain — on every screen, every document and every page your customer sees. There is no supplier logo anywhere in the product, because there is no company name or colour written into a single component.

It is your database. One deployment per customer. Your data sits in your own PostgreSQL instance, in the region you choose, and you can have a full export of it any day you ask. There is no shared tenant, no pooled table, and nothing to disentangle if you leave.

Separation is enforced below the application. Branch scoping, immutability and audit are enforced by database policies — 75 of them across 57 tables — not by application code that can forget. A request for another branch's shipment returns *not found*, because the row is not visible to the query at all.

What it costs you to try

A 15-working-day pilot on your own data. Your busiest lane, your rate card, your customers, twenty of your completed job files. At the end you type one of your own shipment references into a phone and watch it answer.

The fee is fixed, small enough to decide in one meeting, and credited in full against the full build if you proceed. Nothing built in the pilot is thrown away — it is the foundation of the live system.

What is not in it yet, said plainly

Container tracking feeds, direct customs filing in Kuwait, and accounting-package connectors are not in this release. UAE MPCI filing and Saudi ZATCA e-invoicing are on the roadmap with dates. The agent portal, WhatsApp notification and scheduled email reports are in delivery. We will show you the list in the first meeting rather than the third.
