Website Copy

Ready to paste. Headings are marked `H1` / `H2`; everything else is body copy. Notes to the person building the page are in blockquotes and are **not** copy.

> **Arabic.** Every page here needs an Arabic counterpart, and the Arabic is not a translation pass at the end — it is a rewrite by someone who sells freight in Arabic. Nothing on this site may ship in Arabic that a native speaker has not read aloud. Build the page right-to-left from the start — the direction set on the document, spacing that follows the reading direction rather than fixed left and right margins — which is the same rule the product itself follows. A mirrored English site reads as an insult in Riyadh.
>
> **Tone.** Declarative, specific, no superlatives. The product's own interface copy is the style guide: *"Everything wrong across live shipments, oldest first — the one nobody has looked at."* Never "revolutionise", "seamless", "cutting-edge", "empower" or "solution". If a sentence could appear on any software company's website, delete it.

Homepage

`H1`

Freight forwarding software built in the Gulf, for the Gulf.

Sub-heading

Arabic and English from the first line of code. Your brand on it, your database under it, your data yours.

> **Primary call to action:** *See it on your own data — 15 days* **Secondary:** *Track a shipment* (links to a live demo tracking page)

`H2` The problem is not your people

Your rates are in spreadsheets, so a quotation takes a day and a half. Your enquiries are in four mailboxes, so nobody owns them and nobody is timed. Your customers find out where their container is by ringing someone who has to go and find out. And your margin on a job is a number you reconstruct at month-end rather than one you knew when you quoted.

Every one of those is a system-of-record problem. It costs you the jobs you priced too slowly, and the ones you priced too cheaply.

`H2` What changes

> **Layout:** six cards, two rows of three. Each card is a heading and two sentences. No icons of trucks.

Quotations in seconds Load your carrier contracts once and an enquiry prices itself — sea FCL, sea LCL, air, land and courier. Chargeable weight, accessorials and your margin, all before you press send.

One enquiry queue, with a clock Every enquiry across every branch, each with an owner and a response deadline. What breached, what is due today, and who has not replied yet.

An operations board that shows you the problem Live shipments ordered by what has gone wrong, oldest first. The one nobody has looked at is the one the process missed.

Free time that counts itself Demurrage, detention and storage clocks run against the carrier's free days and write their own charge lines. Nobody has to remember, and nobody has to be told.

Your customers stop calling A public tracking page — a reference and a container number, no account needed — and a full portal with the documents you have released. Both in Arabic.

What you are owed, on one screen Invoices across entities and currencies, receipts, ageing, and who to ring about the oldest debt. Every charge line keeps its own exchange rate and the moment it was taken.

H2 Bilingual, not translated

Two thousand seven hundred interface strings in Arabic and English, kept in sync, with right-to-left in the layout rather than bolted onto it. The quotation your customer opens in Arabic reads the way an Arabic document should, because it was built that way rather than mirrored.

Every product in this market was built in English and had Arabic added afterwards. You can tell within about four seconds, and so can your customer.

> **Show, do not tell:** put the same screen side by side, English and Arabic, above this paragraph. It makes the argument better than the words do.

H2 Your brand. Nowhere ours.

There is no colour, no logo and no company name written into this product anywhere — the operator is a setting, not a hard-coded value. So it runs on your domain, under your identity, with your own entity's name on every document it issues, and there is no supplier badge on anything your customer ever sees.

H2 Your database, in your region

One deployment per customer. Your own database, in Kuwait, the UAE, Saudi Arabia or the EU — you choose. Not a shared table with a customer column in it.

You can have a complete export of everything, any day you ask. If you ever leave, there is nothing to disentangle, because none of it was entangled.

H2 What holds when people are careless

Branch separation is enforced by the database itself, on every record — not by application code that can forget one query. Ask for another branch's shipment and it comes back *not found*, because the row is not visible to your request at all.

The audit trail is written by the database itself, so a change that goes around the application is still recorded. Editing it is revoked from every account in the system — your administrator's, and ours.

And nothing is ever deleted. Records are superseded, closed or deactivated. The permission to delete does not exist on the account the application runs as.

H2 Fifteen days on your own data

Not a demonstration on sample data. Your busiest lane, your rate card, your customers, twenty of your own completed job files — in a working system, in fifteen working days.

At the end of it you type one of your own shipment references into a phone and watch it answer.

Fixed fee, credited in full against the full build if you go ahead. Nothing built in the pilot is thrown away; it is the foundation of the live system.

> **Call to action:** *Start the conversation* → contact form. **Form fields:** name, company, email, phone, number of branches, what you use today. Six fields. Every field beyond six halves completion.

H2 What is not in it

> **Keep this section on the homepage.** The instinct will be to bury it. Resist it: this is the section that makes the rest of the page believable, and the buyers in this market have been oversold before.

Carrier tracking is built for Maersk, Hapag-Lloyd and CMA CGM, but it runs on your own carrier API credentials and is not live until you hold them. Direct customs filing in Kuwait is not planned, and direct connectors to accounting packages are not in the current release — there is a file export your accountant can import. UAE MPCI filing and Saudi ZATCA e-invoicing are on the roadmap with dates: the invoice data is ready, the accredited transmission is not. The agent portal and scheduled reports are in delivery. WhatsApp is not in this release.

We would rather you read that here than find it out in week three.

Product page — Commercial

H1 From enquiry to quotation, in one place

Sub-heading

Every enquiry, wherever it came from, with an owner and a clock — and a price that comes from your own contracts.

The queue. Enquiries from the web form, from email, from the phone, all in one list across every branch. Each has an owner, a status and a response deadline. The dashboard tells you what has breached, what is due today, and how long you are actually taking — measured, not estimated.

The inbox. An enquiry emailed to a branch mailbox is read into a proposal — parties, lane, cargo, what was asked for — which the coordinator accepts or rejects. Nothing becomes an enquiry without a person saying so, and what the reader proposed is kept beside what the person decided.

The pricing. Your buy and sell rate cards, by lane, mode and carrier, with validity dates that make two overlapping cards on a lane impossible rather than merely unlikely. Chargeable weight is calculated per mode. Accessorials come from a catalogue you control.

The margin. Buy, sell and margin side by side on the internal comparison, on every option, before the quotation goes out. Not reconstructed at month-end.

The quotation. Under your own entity's name, in Arabic or English, with your trading conditions, your exclusions and a validity date. Revisions supersede rather than overwrite, so what the customer accepted is always recoverable.

The award. Accepting a quotation opens the job file with the rates already attached, so what you sold is what you cost.

And the lanes you are quoting blind. The rate-card screen shows which lanes have no live buying rate on file, and which cards expire in the next thirty days. A lane with no buying rate is a lane you are pricing from memory.

Product page — Operations

`H1` The board tells you what is wrong before the customer does

Sub-heading

Live shipments ordered by exception, oldest first.

The job file. Milestones by mode and direction, planned, revised and actual — all three kept, because the difference between them is the conversation. Master bill, house bill, booking, vessel and voyage or flight, containers and seals, commodity, incoterm, weights and volume.

Exceptions. Everything wrong across live shipments, with severity, an owner, a due date and a cost impact. Ordered oldest first, on the principle that the one nobody has looked at is the one the process missed.

Customs. Declarations in clearance ordered by the window that closes first. Declaration type and number, status from documents-pending through to released, duty, broker and the clearance deadline. A duty estimate from the tariff table before the declaration goes in. Holds and inspections are visible on the board, not buried in a file.

Consolidation. A master with its houses under it, the manifest generated from them, and the master's costs apportioned across the houses so that the margin on each one is real rather than reconstructed.

Free time. Demurrage, detention and storage clocks against the carrier's free days, per container. When free time runs out the clock writes its own charge line, against the right counterparty, at the right per-diem rate. Nobody has to notice.

Documents. Typed and versioned against the shipment, with per-document release control — released documents appear to the customer, drafts do not. Superseded versions stay visible, because a system where a document can quietly change is not a system of record.

Documents the job file writes itself. House bill of lading or air waybill, delivery order, packing list, customs pack with the duty estimate, consolidation manifest — bilingual PDFs generated from the job data, under the issuing branch's name, numbered from the branch's own series. Preview before issue; every issue is a version.

Ask it. An assistant that answers questions over your own data — which shipments have an open exception, whose free time runs out this week, which enquiries are past their clock, which invoices are overdue, where a supplier billed more than the job accrued. It sees exactly what the person asking is allowed to see, and nothing else.

Product page — Finance

`H1` What you are owed, how late it is, and who to ring

Sub-heading

Job costing, invoicing and receivables across entities and currencies.

Job costing. Every cost and every revenue line against the job, so margin is live rather than annual. Accrued charges — including the ones the free-time clocks wrote themselves — appear as they happen.

Invoicing. Per entity, in the entity's own currency, with the tax treatment and rate carried per line. Draft, approved, issued, part-paid, paid, credited — each step separated, and only Finance may issue, void or credit. An operations manager who can issue invoices is the segregation-of-duties failure an auditor asks about first.

Currency, handled properly. Money is decimal throughout and rounds per currency at the line, because the Kuwaiti dinar carries three decimal places and a system that rounds everything to two corrupts every Kuwaiti amount it touches. Every charge line stores its own exchange rate and the moment it was taken, so a quote priced in dollars and invoiced in dinars still reconciles six months later.

Receivables. What is owed, grouped by how late it is, with the largest exposure first. Receipts recorded and matched to invoices — and an explicit warning about unmatched money, because until it is matched the customer still shows as owing what they have already paid.

Credit. Each customer's standing against their limit and their ageing, checked at the moment a shipment is booked — and an override, when you choose to give one, that is recorded with who gave it and why.

Supplier bills. An uploaded scan, or a bill emailed in by a partner you already know, is read into lines and matched against what the job accrued. The variance is on the screen before anyone approves it, which is where the argument with the agent belongs — not after the customer has been invoiced. Agent accounts are netted period by period — one balance, not a receivable and a payable that never meet; supplier payments are recorded against the bills they settle.

Unbilled revenue. What has been earned and not yet invoiced, by shipment, with one act to draft the invoice for it.

Export. A complete export of your financial data whenever you want it, in a form your accountant can use — a journal of the period's invoices, receipts, supplier bills and payments. Draft it as often as you like; posting it marks what it took, so nothing is exported twice.

Tracking page

> **Copy already lives in the product** — it is the tracking page's own wording, in both languages. Do not rewrite it for the website; take it verbatim so that the page a prospect sees on the marketing site is the page their customer will see. If the two drift, one of them is a lie.

`H1` **Track a shipment** Enter your reference and a second identifier — no account needed.

Shipment reference · Container or bill of lading number *Any container, booking or bill number on the shipment.*

FAQ

Is my data shared with other customers? No. Each customer gets their own database in their own instance — not a shared table with a customer column. Separation is not a filter that could be forgotten in one query; it is the boundary of the deployment.

Where is it hosted? Kuwait, the UAE, Saudi Arabia or the EU. You choose, and it is written into the contract.

Can I get my data out? A complete export, in an open format, any day you ask. It is not a retention feature and there is no charge for it.

Does it work in Arabic? Throughout — interface, documents, portal and tracking page. Right-to-left is in the layout rather than applied to it. Try the tracking demo and switch languages.

How long does implementation take? Fifteen working days for the pilot, from the day your data arrives rather than from signature. A full implementation depends on how many entities and how much history you are bringing — it is quoted as a fixed fee, not by the hour.

What do you need from us? A rate card in whatever form it currently exists — uncleaned, we want to see the mess. Fifteen to twenty-five completed job files in any format. Your customer and agent lists. Your logo and one existing quotation for the letterhead. And ninety minutes with someone who runs operations, so the milestones are named the way your people actually name them.

Can we keep using our accounting package? Yes. Financial data exports in a form your accountant can import. Direct connectors to specific packages are not in this release.

Do you file customs declarations? We track them — type, number, status, duty, broker and clearance deadline — across the whole clearance lifecycle, and estimate the duty before the declaration goes in. We do not file directly to Kuwait customs and are not planning to; access there runs through a long-running concession we have no route into, and we would rather say so than imply otherwise.

What about UAE MPCI and Saudi e-invoicing? Both on the roadmap with dates, neither shipped. Every invoice already carries tax treatment and rate per line, and the hand-off to an accredited provider is built as a plug; the mandated document format and the provider itself are what remain. Ask us where they are and you will get the real answer, in writing.

Does it read our email? Only the mailboxes you connect, each bound to a branch. An enquiry that arrives there is read into a proposal your coordinator accepts or rejects; a bill from a partner you already know is read into lines and matched against the job. A person decides every time. WhatsApp is not connected in this

release.

Do you track containers with the carriers? The connection is built for Maersk, Hapag-Lloyd and CMA CGM, and it runs on your own carrier API credentials rather than ours. Until you hold them, milestones are entered by hand — and that is what we will tell you in the first meeting.

Can our other systems read from it? Yes. A read-only API with a per-customer key — each key sees exactly what its owner is allowed to see, decided by the same database policies as the screens — and outbound webhooks, signed, with delivery retried and logged, for the events you subscribe to.

What happens if you go out of business? Your deployment is your database in your instance, the schema is documented, the export is complete and available at any time, and source escrow is available on request. The risk is real and it is bounded — we would rather discuss it than be asked about it later.

Can your support staff see our data? Not unless you grant it. Access is granted by your administrator, scoped to named branches, read-only or read-write, against a ticket reference, and it expires on its own. Every session opened under that grant is recorded in a log that neither you nor we can edit afterwards, and while it is live a banner shows on every page of your system. You can revoke it in one click.

Footer

CargoSharks — freight forwarding software for the Gulf. Built with AL-QABANDI & PARTNERS Co. (Shipping & Forwarding), Kuwait.

> **Reference-customer naming requires written permission.** Until it is in hand, replace the second line with *"Built with a Kuwaiti forwarder, on their own operation."* — which is true, credible and safe.

`hello@cargosharks.com` · Kuwait City

> **Legal pages required before launch:** privacy policy naming the hosting region and the retention period, terms of service, and a data-processing addendum. A prospect's IT reviewer looks for these before they look at the product, and their absence reads as inexperience.
